1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claim 1 is rejected under 35 U.S.C. 102(b) as being anticipated by Williams.

Williams teaches a pipette shaft having a cylindrical sealing zone (either of the portions 276 or 279 below the point of contact at part 274 of the pipette tip) with a spaced cylindrical support zone above or below the point of contact at either part 274 or 276 of the pipette tip. The annular sealing rings have a first predetermined diameter and the spaces above and below them have differing predetermined diameters.

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

4. Brysch additionally teaches a pipette shaft and tip in which a portion 4 of the shaft is smaller than the inner diameter of the tip in a region spaced from the sealing region 5. Applicant has defined "substantially cylindrical" as having a taper of 1.5 degrees or less (p. 27) and it is not clear that either of section 4 or 5 meet this definition.

5. Applicant's arguments filed March 6, 2002 have been fully considered but they are not persuasive.

6. Applicant argues that the instant pipette and tip combination is designed to have a single sealing region, but the instant claims are not so limited in that they do not preclude a second sealing region. Applicant further argues that the tip of Williams requires more mounting/removal force, but there are no claim limitations directed to this

Art Unit: 1743

feature, such as mounting force or the degree of deformation of the sealing region of the tip or the number (" a single") of sealing regions. The examiner notes that the sealing regions of the tip of Williams have predetermined diameters, as do the regions above and below the sealing regions, the regions above and below having a diameter larger than the pipette shaft diameter, resulting in the gaps shown. Compare Figure 6C, 7 or 8 of Williams to Figure 4 of the instant specification.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Jan M. Ludlow whose telephone number is (703) 308-4039. The examiner can normally be reached on Monday-Thursday, 11:30 am - 8:00 pm.
